for these subjects is from 7 to 64 years with a median of 14.7 years over the groups. These ABIDE I data have been collected from COINS [44] for the execution of this work. T1-weighted sMRI scans of 484 ASD and 491 Controls have been considered for the experiment.

2.2. On-the-fly data augmentation

To avoid the problem of overfitting and for proposing the generalized model, the data augmentation approach has been utilized for the execution of this work. The kind of data augmentation approach which has been used is also known as the 'on-the-fly data augmentation'
